Task #5230

Mission Statement

The Genesee/Finger Lakes Regional Planning Council (G/FLRPC) will identify, define and inform its member counties of issues and opportunities critical to the physical, economic, and social health of the region. G/FLRPC provides forums for discussion, debate, and consensus building, and develops and implements a focused action plan with clearly defined outcomes, which include programs, personnel, and funding.

I. Introduction

This report includes population projections out to the year 2040 for the all counties, cities, towns, and villages in the Genesee/Finger Lakes Region. A top down approach was used, where the region was capped within New York State, and then each county within the region, and finally all the municipalities within the counties were finalized.

II. Methodology

The methodology was developed primarily by the Capital District Regional Planning Commission, and has been reviewed and agreed upon by the other Regional Planning Organizations within New York State.

The Population Projection Model involves two distinct stages: a quantitative first stage using a log-linear projection model set up in a MS Excel Workbook, and a qualitative second stage using non-quantitative judgments of the likelihood and extent of future population change within particular jurisdictions. The result is a final population projection for each county, and the towns and villages within it.

A. Quantitative Stage

The Log-Linear model — so-called because of its straight-line form when plotted and a logarithmic scale for X-axis measurements — uses historic population to forecast or project future population based on a logarithmic curve, which is the best general model for natural populations.

The mathematical form of the model is:

$$Y = b0 + b1 \times \ln(X)$$

Where Y = the Dependent Variable population and X = the Independent Variable for the time period (years or index years). The Y -Intercept (point at which $\ln(X) = 0$) is represented by b_0 , while b_1 represents the Coefficient or slope of the natural logarithm (base $e = 2.71828183$) of X [$\ln(X)$]. After converting the Independent Variable X into logs (log transformation), the Model is “fitted” by the standard (least squares) method of minimizing the sum of the squares of the deviations between the Model values and the actual values as in a Simple Regression Model.

Log-Linear models when used for forecasts project the historic rate of change of the actual data into the future at a steadily declining rate (i.e., historic growth or decline will continue, but at a lesser rate). Log-linear models are an excellent basis for population forecasts because they project average historic rates of change into the future in a manner consistent with the average changes in natural populations. While short-term population data will typically exhibit some variety of saw tooth pattern when charted, long-term population data usually follow a log-linear trend.

The MS Excel Workbook requires input of historic (and optionally, Census-estimated) population data for the region's nine counties and its towns and villages. The sum of the historic populations of the sub-divisions (counties) should equal the region total, as should each county's town and village total equal the county population. Thus, in the case of a county and its Minor Civil Divisions (MCDs), a town may be divided into its constituent villages together with the town population outside of the villages. A MCD may also be divided into the population in group quarters (e.g., for prisons and dormitories) and the population in households to better reflect the diverse population trends of the defined sub-divisions.

The Workbook model uses "Index Years" in place of actual years for computing the natural logs of the *Independent Variables*, with the first year, 1960, set equal to one ($1960 = 1$). The default "Log Index Factor" for each area and sub-division has been set to one, so that $1961 = 2$, $1962 = 3$, $1990 = 31$, etc. Varying the Log Index Factor will change the slopes of the Population Trend, Initial Projections, and Final Projections for the area or sub-division selected because the absolute value of the slope of a log-linear model declines as the model's X-values increase. Thus, entering a number greater than one (e.g., 2, so that $1961 = 3$, $1962 = 5$, etc.) as a *Log Index Factor* will result in smaller slopes (absolute value) for the *Population Trend*, *Initial Projections*, and *Final Projections*. Whereas entering a number less than one but greater than zero (e.g., 0.5, so that $1961 = 1.5$, $1962 = 2$, etc.) will result in larger slopes (absolute value).

Once the historic (and estimated) data was entered and the Log Index Factor set, the Workbook Model computed the *Log-Linear Population Trends* of the data using simple regressions on the population data and the natural log of the Index Years. It next computed *Initial Projections* based on the *Population Trends* and the historic (and estimated) data. The Initial Projections are derived by computing the difference between the actual data and the Population Trend data for the last year of the actual data (either historic or estimated), and adding that difference to the coefficients of the Population Trends. This creates new trend lines that extend directly from the last year of the actual data and have the same shape (slopes) as the Population Trend lines.

The final procedure in the Quantitative Stage is to force the sum of the sub-divisions to equal the area total for each projection year. Given the independently derived nature of the area and sub-division projections, the

sum of the sub-division projections for any particular projection year will virtually never equal the area total. The Workbook Model computes for each projection year the value (factor) which, when applied to all sub-division projections, will yield a sub-division sum equal to the area total. The use of a constant factor (0% < Factor ≤ 300%) applied to all of the sub-divisions within a projection year results in distributing the required gain or loss of population in proportion to each sub-division's population size.

The extent to which sub-divisions must be adjusted to equal the area total checks the reasonableness of the log-linear trend used in the quantitative model. Adjustment factors for one or more projection years that are much less than 90% or much greater than 110% may indicate a discrepancy between the trends fitted to the area total and the trends fitted to the sub-divisions. This may be reduced by changing the *Log Index Factor* or *making Flat Revisions* to area or sub-division values.

B. Qualitative Stage Methodology

The projections derived from the Log-Linear Model provide a basis from which to further analyze the forces that affect population change in each area and sub-division, and are not necessarily intended to represent final population projections. There are many historic trends other than simple population which may give an indication of the direction and extent of future population change, including but not limited to: average persons per household, persons in group quarters, building permit issuances, new home construction, immigration and emigration patterns, and labor force data. In addition, there may be new development opportunities or constraints for particular jurisdictions embodied in zoning and sub-division regulations, economic development programs, and capital budgets for transportation facilities. Infrastructure is also

looked at as an asset or liability to growth and development in the municipalities. As much of this information as possible has been considered in reviewing the projections derived from the Log-Linear Model for each jurisdiction, and changes made as appropriate.

The forecasts first take into consideration the population occupying group quarters. The number of people occupying group quarters were removed from the total population for each county, town, and village before being run through the Model and were then added in as a flat revision after the projections have been made. This ensures that the group quarter numbers, which are typically static, are not factored in as a population that will have a natural increase over time. New or expanded group quarters and the elimination or downsizing of group quarters are additionally taken into account as flat revisions.

Additional considerations used to modify forecast numbers after being run through the model are as follows:

Input/Output

This includes looking at the total number of births and deaths for each town and village. In addition, the number of people migrating into and out of the area was taken into consideration. The total number of people coming into the area, through new births and in-migration, minus the number of people who have died or left the area yields a new population through 2000. The trend birth and death rates are following, in addition to in and out-migration trends can therefore be used for evaluating and modifying the initial population projections through 2040.

Housing and Occupancy Data

Following the trends in new housing construction in the towns and villages gives another check to the projections obtained through the model. By utilizing data such as the: 1) number of new major subdivisions, which is classified by producing at least four lots, 2) total number of lots resulting from new major subdivisions, 3) persons per household, 4) vacancy rate, and 5) building permit activity, new population entering the municipality can be estimated. The number of new housing lots, minus the number of vacant housing units, is multiplied by the average persons per household for that municipality resulting in the number of new residents in the municipality. This trend can then be projected through 2040 and used to modify initial forecast numbers.

Land Use and Regulatory Considerations

Each municipality has unique circumstances that require special consideration. Since quantitative data alone cannot accurately portray the possibilities for future growth or development, additional information was acquired from town and village officials. This includes the acreage available for residential development, the existence and condition of infrastructure, municipal growth management policies and the land use and zoning of available land. A contact at each county was actively involved in providing this information and supplying additional comments that may assist in modifying the initial population projections.

This information provides an overview of the growth potential for each municipality and is an indicator of the type of future development that is likely to occur. Therefore, the quantitative data was complemented by qualitative information resulting in the best forecast possible.

III. Review Process

Each county planning department has had the opportunity to review and comment on the methodology, initial projections, and final projections. Once the initial projections were completed, G/FLRPC staff went to each county with supporting data and discussed modifications that needed to be made that the quantitative portion of the model would not take into consideration. All modifications that were made to the initial figures were recorded and a justification was given to the county planners for review. At every stage, the county planners have been involved in the process and have given G/FLRPC staff the critical support and information to make the best possible forecasts.

The model is heavily dependent on historical data. Rural towns and villages can increase their population by a significant percentage as a result of a new mobile home park or new subdivision. Since many of the towns and villages have a very small base population, this type of new development would greatly impact the growth rate. However, this type of development is not as predictable in rural areas as it may be in more urbanized areas. Furthermore, much of the data collected for the qualitative portion of the methodology is not as significant in rural counties. For example, looking at the amount of land available for residential development in a rural town is not indicative of the potential for growth. Although some urban towns are inhibited by the amount of land available for

new developments, rural areas have more land available than is often in demand. These types of qualitative indicators were, therefore, not given as much consideration in the projection process.

The Genesee/Finger Lakes Region of New York State

GENESEE/FINGER LAKES REGION

IV. Genesee/Finger Lakes Trends

The Genesee/Finger Lakes Region has been increasing in population since 1960 and there is no indication that this trend will stop anytime soon. In the last 40 years, the population has increased by 27%, almost 260,000 people. It is projected that future population will be increasing at a decreasing rate. It is projected that the region will grow by 5.1% from 2000 to 2040, an increase of 61,553 people. Yates County is projected to have the highest percent increase at 16%. This is largely due to the fact that the population in Yates County is much smaller than most of the other counties in the region.

Other counties with a higher projected population increase than the region average include Livingston (8.0%), Ontario (8.0%), Orleans (9.3%) and Wayne (5.7%). These counties all have towns that are in close proximity to the Rochester Metropolitan Area. In addition, Livingston, Ontario and Wayne County all have towns included in the Rochester Transportation Management Area (TMA), which is among the highest growth areas in the region. These communities serve as outer ring suburbs and are being developed at a fairly significant rate.

Falling just slightly below the projected region average is Monroe County at 5.0%. Having been the focal point for much of the region in the past 40 years, with a population increase of almost 150,000 people, the projected population follows the regional trend of increasing at a decreasing rate.

Since 1980, the population in Wyoming County has increased, but at a declining rate. Although Wyoming County is projected to have an average increase of 0.3% by the year 2040, all indications are that the population will peak

during 2010. After this, it is projected that the population will begin to decrease at an increasing rate. Much of this is related to migration patterns within the county.

Genesee and Seneca Counties differ from the regional trend in that they both have a negative average percent change (Genesee County, -2.7% and Seneca County, -1.5%). Even though Genesee County's population has been increasing, its net difference has significantly dropped since 1960. After an increase of 8.8% between 1960 and 1970 the increase fell to 0.5% between 1990 and 2000. In Seneca County, the population has been decreasing since 1970. This was primarily due to some major industrial closings and military base downsizing within the county. Along with economic development efforts to reverse that trend, major developments in the eastern portion of Ontario County may potentially have a positive effect on Seneca County. Therefore, the decrease in population will continue but at a decreasing rate.

Overall, it is projected that the Genesee/Finger Lakes Region will remain demographically strong with county shares remaining fairly stable. The largest county in the region, Monroe, had 62.4% of the region's population in 1960, and is projected to have 61.2% of the population in 2040. The smallest county, Yates, went from 2.0% of the region population in 1960, to a projected 2.3% in 2040.

Although each county has unique features that affect its population and trends, some were evident throughout the entire region. Birth rates were generally decreasing while death rates were on the rise. In general, village populations have leveled off or begun to decrease due largely to limited space and a declining persons per household. For the past few years, regional out-migration is higher than in-migration.

Historical and Projected Percent Changes

Percent of Region's Population by County

GENESEE COUNTY

V. Genesee County Trends

Genesee County is made up of 13 towns, 6 villages, the City of Batavia, and the Tonawanda Reservation. From 1960 to 1970 the population increased by 4,728, but has increased at a much slower rate since then. From 1990 to 2000 the population increased by only 310 people. This declining rate of increase has caused the county projection as a whole to begin showing a loss in population by 2010. As a percentage, the total loss through 2040 is projected to be 2.7 % with no decade having a loss of more than 1.0% from the previous decade.

It is projected that the towns that will have the greatest increase in population will be Bergen, Byron, and LeRoy. These three towns, located in the northeast corner of Genesee County, have adequate land still available for residential development and will likely see some migration from Monroe County. The numbers are not drastic, but the population has historically been stable and will likely continue to be so in the future.

With a current population of over 16,000 people, the City of Batavia is the center of Genesee County. Although the historical trend has shown the decreasing population rate to be declining, the projection still has the city losing population in the future. The City of Batavia has decreased in population by almost 2,000 people since 1960 and is projected to lose 1,200 more by the year 2040. This may seem high, but the average decennial percent change is only a 2.0% decrease. A good number of city residents are projected to migrate into the Town of Batavia, which has a slight projected increase in population after losing 140 people between 1990 and 2000. The remaining towns and villages within Genesee County are projected to remain relatively stable, increasing or decreasing at an average rate around 1.0%.

Towns of Genesee County Trend from 1960-2040

LIVINGSTON COUNTY

VI. Livingston County Trends

Historically, Livingston County has had exceptional growth within the Genesee/Finger Lakes Region. In fact, Livingston County had the second highest growth rate (46%) within the region over the last 40 years. The growth is projected to remain, but not at the high rate of the past. Livingston County is projected to grow by a total of 5,150, over 8.0% of the current population.

With the exception of two municipalities, all towns and villages in Livingston County have a projected increase in population. The Village of Geneseo is projected to increase by 12.2% through 2040, largely due to the fact that SUNY Geneseo is expanding. Towns such as Caledonia (projected 12.2% increase through 2040), Avon (15.5%), and Lima (9.3%) will see an increase in population, likely due to their accessibility to Monroe County and the City of Rochester. Avon is expected to have sizeable development due to its proximity to Interstate 390. The Town of Livonia is projected to grow at an average decennial rate of 3.2% through 2040.

Groveland is a community with a large group quarters population because of two prisons located in the town. It is projected that these prisons will see a slight increase in their population while the Town will have new water and sewer lines for housing development. Leicester will experience a slight increase as well due to a planned small residential development. The population in the Town of Leicester is projected to increase 9.6% by 2040.

Towns of Livingston County Trend from 1960-2040

MONROE COUNTY

VII. Monroe County Trends

Major population changes have been happening within Monroe County for many years, and that scenario will likely continue in the future. From 1960 to 2000, the population increased by 148,956 (25.4%). It is projected to increase by only 37,078 (5.0%) by 2040. Major areas that are projected to have a decrease in population include the City of Rochester, the Town of Irondequoit and the Town/Village of East Rochester. These three places have had declining population for many years. Rochester has plans for residential development throughout the City but it is projected that population will continue to decrease, albeit at a decreasing rate. The rate of decrease is projected to be 1.2% through 2040, compared to the 8.6% average decrease from 1960 to 2000.

The Towns of Greece and Webster have gained the most population over the past few decades. Although Greece has a very small projected increasing rate (3.0%), they will likely pass 100,000 residents by the year 2020. The Town of Webster has seen the most growth since 1990 with an increase of 25% from the previous decade. It is still projected to grow in population, but with a decreasing rate starting at 11.5% by 2010. Other well-populated towns within Monroe County that are projected to see a steady increase in population are Penfield and Perinton. It is projected that the Town of Penfield will have an average increase of 3.9%, while the Town of Perinton will have an average increase of 2.4% through 2040.

As people tend to move further from the City, second and third ring suburbs will also begin to experience an increase in population. It is projected that there will be an average decennial rate of 2.5% increase for the Town of Sweden, 2.6% for the Town of Henrietta, and 8.9% for the Town of Mendon.

Towns of Monroe County Trend from 1960-2040

ONTARIO COUNTY

VII. Ontario County Trends

With a population growth rate of over 47%, Ontario County experienced the largest percent increase from 1960 to 2000 than any other county in the Genesee/Finger Lakes Region. Although the projected growth rate is only 8%, it is projected that Ontario County will have a population of over 108,000 by 2040. It is projected that while the City of Geneva will continue to decline in population at a decreasing rate, the City of Canandaigua will continue to slowly increase.

The Town of Farmington has seen some major increases in the past (150% increase from 1970 to 1980 compared to the previous decade) but will not likely continue that trend. It is projected that the Town will increase slightly (1.6%), much like the more recent decade between 1990 and 2000 (2.0%). It is projected that the Town of Victor will have an average decennial increase of 6.9% through 2040. This is largely due to its proximity to the City of Canandaigua and the City of Rochester. It is also projected that the Town of Canandaigua will have a population increase of 5.4%

The places that are projected to lose population in Ontario County are the Villages of Rushville (-1.4%), Manchester (-1.7%), Shortsville (-1.0%) and Clifton Springs (-0.9%). The recent trend of these Villages has been a decreasing population and it is projected to continue, but at a slower rate.

Towns of Ontario County Trend from 1960-2040

ORLEANS COUNTY

VIII. Orleans County Trends

Having been one of the Region's fastest growing counties, it is projected that Orleans County will continue to grow at a high percentage rate. With an increase of 4,134 through 2040, the average decennial rate is projected to be 9.3%. Unlike the past, when the increase was credited to the county's correctional facilities, the future growth is based on the rise of seasonal homes along Lake Ontario being converted into year-round housing and residential growth in the eastern part of the County. These include the Towns of Kendall (projected 13.6% total increase in population through 2040), Murray (11.5%) and Clarendon (18.9%) that border Monroe County. Water lines along Route 531 are promoting more development on the eastern part of the county as well.

The Town of Albion has had a significant increase in population since 1980 (over 2,400) largely due to the addition of group quarter facilities. During the past two decades, the household population in the Town of Albion has remained relatively stable. It is projected that the population will increase at a much slower rate because the addition was a one-time event.

Most of the other towns in Orleans County are maintaining a relatively stable population. All are projected to gain in population at a decreasing rate. It is projected that a large portion of the increase will occur within the next decade and will then begin to taper off. A 6.3% increase is projected through 2020, while only a 2.8% increase is projected from 2020 to 2040, bringing the total population to just over 48,000.

Towns of Orleans County Trend from 1960-2040

SENECA COUNTY

IX. Seneca County Trends

Major changes occurred in Seneca County during 2000 that were not reflected in the 2000 Census. The Five Point Correctional Facility opened in the Town of Romulus increasing its population and bringing in new jobs. The Town of Varick lost military housing in the 1990 to 2000 time frame causing its total population to decrease. KidsPeace, Seneca Wood campus has since opened up, adding almost 200 people to the population.

These projections are not impacted by institutional events that occurred in the decades between 1980 and 2000. During this time Eisenhower College in Seneca Falls closed and the campus later reopened as the New York Chiropractic College. The Army developed new housing during the 1980's and then closed down operations at the Seneca Army Depot during the 1990's. The State closed the Psychiatric hospital in Willard, later converting it into the Willard Correctional Facility. The closing of Phillips Industries in Seneca Falls contributed to the town losing 16.8% of its population between 1980 and 1990.

The only towns projected to increase in total population by the year 2040 are Junius (2.0%), Romulus (26%) and Seneca Falls (5.2%). Although many of the towns and villages are projected to lose population, these losses begin to taper off starting in the next decade. It is projected that Seneca County's loss in population will be only 515 at an average rate of 0.3% each decade.

Towns of Seneca County Trend from 1960-2040

WAYNE COUNTY

X. Wayne County Trends

Wayne County is projected to have an average decennial increase of 1.4% and a total percent increase in population of 5.7% through 2040. Since a large increase in population between 1960 and 1970 of 16.8%, Wayne County's population has been increasing at a decreasing rate. The projected population follows this pattern but at a lower rate. By 2040, the population in Wayne County is projected to be slightly below 100,000 with a sizeable increase of 4,171 in population over the next two decades.

The western-most towns of Wayne County have historically been the most populated. The Town of Ontario has a total percent increase projected at 12.9% with an average decennial rate of 3.2% through 2040. The Town of Walworth has a total percent increase of 17.1% with an average decennial rate of 4.2%. Much like Walworth, the Town of Macedon has a total percent increase of 17.2%, with an average decennial rate of 4.3%. These three towns combined are projected to make up 30% of the total population of Wayne County by 2040.

The Village of Newark has been losing population since 1960 and is projected to continue to decline in population at a slightly higher rate than the past two decades. Water lines along NYS Route 104 (Ridge Road) will allow for more industrial development in the Towns of Huron and Sodus. These towns each have a projected total percent increase of 5.0% through 2040.

Towns of Wayne County Trend from 1960-2040

WYOMING COUNTY

XI. Wyoming County Trends

Wyoming County has increased in population the last 40 years but only by 917 between 1990 and 2000 compared to 2,895 between 1960 and 1970. Migration patterns and lower birth rates have affected Wyoming County's projected population, causing it to stop increasing by 2010, where it will then begin to decline at an increasing rate (total loss of 2.0% between 2010 and 2040). Wyoming County's population trend is fairly consistent with other rural areas in western New York.

The Town of Arcade is likely to experience a population increase because of its inexpensive electric power that has facilitated economic and residential development. The projected total percent increase for the Town of Arcade is 7.7% through 2040 with an average decennial rate of 1.9%. The Town of Bennington is likely to experience some population growth as well because of its close proximity to a metropolitan center (City of Buffalo). It is likely that Bennington will have significant new public water in the coming decades and is projected to increase at an average decennial rate of 1.6% through 2040 with a 5.5% total increase. The Village of Castile also has inexpensive electric power and is actively pursuing a sewer system in the near future that would make it an attractive community in the eastern portion of Wyoming County.

The Town of Perry, after feeling the effects of losing the Champion Textile Factory in the late 1990's (a 9.0% decrease in population), is projected to continue to experience decreasing population through 2040 at a much slower rate. The Village of Perry has historically lost population from year to year and is projected to continue to do so but at a decreasing rate. It is projected that the Village's economic development efforts will lower the number of people leaving the community, eventually neutralizing the decreasing trend.

Towns of Wyoming County Trend from 1960-2040

YATES COUNTY

XII. Yates County Trends

The population in Yates County increased by 6,007 (32.2%) between 1960 to 2000, and is projected to increase by 4,026 (16.3%) between 2000 to 2040. Although the percentage is extremely high compared to the region average, the average decennial rate is only 4.6% and decreases each decade through 2040. Yates County is very rural with the Village of Penn Yan being its most populated community of just over 5,200 residents in 2000. The projected trend is that the Village will decline in population but only at an average decennial rate of 0.1% through 2040. After a loss of population in the 1990's, Penn Yan is projected to gain slightly by 2010 with efforts to remove brownfields near Keuka Lake and replace them with single-family homes.

The largest gain in population is projected to occur in the Town of Jerusalem with an increase of 956 people at an average decennial rate of 5.0% through 2040. With its proximity to Keuka Lake, Jerusalem is feeling the growth pressure of the 1990's when many people started to convert seasonal homes into year round housing. Yates County is feeling the effects of retirees migrating in.

The Town of Middlesex has seen over a 50% increase in its population over the past 40 years and is projected to continue to increase but not at the same rate. Many people living in Middlesex are located close to Canandaigua Lake and commute to the City of Canandaigua for work. The decennial net increase is projected to be similar to the historical figures but the total percent increase through 2040 is forecasted to be 25%. The Town of Benton has seen a large increase in population mainly due to the increasing number of Mennonite families. The last two decades saw an increase of over 30% in total population, but is projected to be lower in the future due to the rural nature of Benton.

Historical and Projected Population for Yates County
